Project Title : Corporate Compliance and Certification Tracker

Abstract:

Many companies have to make sure that their employees complete the required training programs and keep their certificates valid. This is especially important in fields like healthcare, construction, finance, and manufacturing, where employees need certifications such as safety training, CPR, or data privacy. In many small and medium-sized companies, these details are still stored in Excel sheets or paper records. As the number of employees increases, it becomes difficult for the HR team to check whose certificate has expired or which employee needs to renew their training. Missing these deadlines can cause legal problems, financial penalties, and even affect the company's daily work.

To solve this problem, our project is to develop a Corporate Compliance and Certification Tracker using a database management system. The main purpose of this project is to store all employee certification details in one place and make it easy to manage them. Instead of checking files manually, HR staff can quickly find the status of any employee and know if a

certification is about to expire. This will save time and reduce mistakes that usually happen during manual record keeping.

The system will store information about employees, departments, job roles, certifications, training programs, and certification providers. Since one employee can have multiple certifications and the same certification can be required for many employees, the database will use proper table relationships to manage this data efficiently. The system will also keep track of issue dates and expiry dates so that expired or soon-to-expire certificates can be identified automatically. Old certification records will also be stored, which will be useful during company audits or future reference.

The main users of this system will be HR staff, compliance officers, department managers, and administrators. HR can add new employees, assign certifications, update training records, and check compliance status. Managers can view the certification details of employees in their departments, while administrators can manage the overall system and update certification or training information whenever required.

Apart from basic add, update, delete, and search operations, the project will include features like automatic expiry checking, reminder generation, report creation, filtering employees based on certification status, and viewing compliance summaries. From the database side, the project will use concepts like primary keys, foreign keys, joins, normalization, aggregate functions, date functions, and many-to-many relationships. These features make the project more than a simple CRUD application and also make it practical enough to be used in a real company. We believe this project is realistic, useful, and can be completed within the given project duration while helping us apply the DBMS concepts learned in class.
